

### General notes:

- Each member MUST work on at least one of the required functions besides file processing
- كل فرد من أفراد المجموعه لازم يشتغل في فانكشن واحده من المشروع على الأقل بجانب شغل ال files، يعني محدش يقول انا اشتغلت على ال files بس 😊
- Evaluation:

The evaluation will be mainly based on the students' ability to use and apply the most suitable data structure(s) for the given task(s) and explain why they used these data structures and why they are better than other data structures in any given case. **You MUST use at least 2 different data structures.**

#### ❖ Regarding ideas that uses files:

You should read data once at the beginning of your run then do your operations and accessing datastructures then save in files at the end of your program \*this will consume time and lines of code\* ;)

<b>Title</b>	<b>وصلني Mini</b>
--------------	-------------------

<b>Description</b>	<p>Your customer wishes to reach his destination in the shortest possible path. Implement a C++ program that allows the user to enter the graph which represents the cities and distances between them, then find the shortest path to reach the destination from any given source city.</p>
<b>Minimum Requirements</b>	<p>-The program should allow the user to:</p> <ol style="list-style-type: none"> <li>1. Add graph (Cities and Distances between them)</li> <li>2. Display graph data</li> <li>3. Update graph data</li> </ol> <p>-Add new city</p> <p>-Add new edge</p> <p>-Delete city (Don't forget the edges that are connected to this city)</p> <p>-Delete edge (The user will enter the names of two cities to delete the edge between them)</p> <ol style="list-style-type: none"> <li>4. Traverse the graph (BFS and DFS)</li> <li>5. Determine two cities as source and destination then find the shortest path between them</li> <li>6. You must</li> </ol> <p style="padding-left: 40px;"><b>-Compute and display total distance of the shortest path</b></p> <p style="padding-left: 40px;"><b>-Display the shortest path (Cities names in the shortest path)</b></p> <p><b><u>-You must implement</u></b></p> <ol style="list-style-type: none"> <li>1-Breadth First Search (BFS)</li> <li>2-Depth First Search (DFS)</li> <li>3-Dijkstra's Algorithm</li> </ol> <p><b>-Use the suitable Data Structure for each Algorithm</b></p> <p><b>-You must use three types or more of data structures in the project</b></p> <p><b>-Implement the graph using Adjacency list</b></p> <p><b>-Save the graph data in file so the user can close the program and reopen it to continue working on the saved graph</b></p> <p><b>-The program must run continuously until the user choose exit</b></p> <p><b><u>For saving Data:</u></b></p> <p>-Load data from the program (Data Structures) into files <b>only once</b> at the end of your program after finishing.</p> <p>-Load data from files into the program (Data Structures) <b>only once</b> at the beginning of the program.</p> <p>Evaluation:</p> <p style="color: red;">The evaluation will be mainly based on the students' ability to use and apply the most suitable data structure(s) for the given task(s) and explain why they used these data structures and why they are better than other data structures in any given case.</p> <p>Clean code is a must.</p>

	Using ready-made libraries with ready-to-use data structures is allowed.
<b>Bonus</b>	-Additional algorithms to find the shortest path. -GUI
<b>Development Tool</b>	-C++ Language / Visual Studio IDE.

<b>Title</b>	<b>Vaccine Tracking System</b>
<b>Description</b>	<p><b>Implement an “Egyptian Vaccine Tracking System” in C++. That allows the users to enter their personal and vaccination information and let the administrator calculate basic statistics to draw insights from such data.</b></p> <p><a href="https://www.washingtonpost.com/graphics/2020/health/covid-vaccine-states-distribution-doses/">[https://www.washingtonpost.com/graphics/2020/health/covid-vaccine-states-distribution-doses/]</a></p> <p>What is meant by Egyptian is that it should be specifically tailored to tracking the vaccination process for Egyptians in Egypt in the sense that the National IDs should be 13 numbers, the user can only enter Egyptian governorates, etc</p> <p>To make things easier, we won’t account for Egyptians living abroad or non-Egyptian residents. Only Egyptian residents.</p>
<b>Minimum Requirements</b>	<p>The program should allow the user to:</p> <ol style="list-style-type: none"> <li>Users may Add personal record containing: <ol style="list-style-type: none"> <li>Full Name.</li> <li>National ID. [Unique = Shouldn’t accept duplicates]</li> <li>Password.</li> <li>Gender.</li> <li>Age.</li> <li>Governorate.</li> <li>Already vaccinated or applying for vaccination?</li> <li>If vaccinated, received only one or both doses?</li> <li>If not, the user should be added to <b>a waiting list</b>.</li> </ol> </li> <li>Users should be able to display only their own records by entering the National ID and Password.</li> <li>Users may Edit/Update any of their information.</li> <li>Users may Delete their personal records.</li> <li>Can sign in as Admin using Admin password.</li> <li>Admin can: <ul style="list-style-type: none"> <li>-View or delete (cannot edit/update) <b>all or any record(s) by entering only Nat. ID.</b></li> <li>-View records filtered by the number of doses (one dose and two doses)</li> <li>-View records of vaccinated users ordered by the age of the user</li> <li>-View the record of the user that needs to be vaccinated from the waiting list</li> <li>-View Basic statistics: <ul style="list-style-type: none"> <li>- Percentage of people registered in the system that have received the first dose.</li> <li>- Percentage of people registered in the system that have received both doses.</li> <li>- Percentage of Females and Males registered in the system.</li> </ul> </li> </ul> </li> </ol>

	<p>-You must use two types or more of data structures in the project</p> <p>-The program must run continuously until the user choose exit</p> <p>-Save data in files so the user can close the program and reopen it to continue working on the saved data. you can use separate files for different types of users (not vaccinated, vaccinated once, vaccinated twice)</p> <p><b>For saving Data:</b></p> <p>-Load data from the program (Data Structures) into files <b>only once</b> at the end of your program after finishing.</p> <p>-Load data from files into the program (Data Structures) <b>only once</b> at the beginning of the program.</p> <p>Evaluation:</p> <p>The evaluation will be mainly based on the students' ability to use and apply the most suitable data structure(s) for the given task(s) and explain why they used these data structures and why they are better than other data structures in any given case.</p> <p>Clean code is a must.</p> <p>Using ready-made libraries with ready-to-use data structures is allowed.</p>
<b>Bonus</b>	<ul style="list-style-type: none"> <li>- Calculate more advanced statistics [Check the Washington post article above] [You may need to ask the user for more information to get more statistical insights].</li> <li>- GUI</li> <li>- Graphs / Data Visualization</li> </ul>
<b>Development Tool</b>	<ul style="list-style-type: none"> <li>- C++ Language / Visual Studio IDE.</li> </ul>

<b>Title</b>	<b>News Management System</b>
--------------	-------------------------------

## Description

News is important for a number of reasons within a society. Mainly to inform the public about events that are around them and may affect them.

Implement C++ program that allows users to get latest news, filter news by category, rate news and display them.

The News Management System should:

- validates user login data either correct or not.
- determines the user either admin or not.
- allows users to rate and view news.
- ignores trivial or incorrect news depending on news ratings (Rates below 2 should be hidden from users).
- displays news descendingly according to rates.
- allows a user to choose which categories he prefers.

News details are :

- 1- Title
- 2- Description.
- 3- Date.
- 4- Rate ( 1 to 5 ).
- 5- Category.

### **Admin Functionalities :**

1. Login
2. Post/ Remove News
3. Update Existing News
4. Add New Category ( Sport, Health) and assign news to them.
5. Display the average rate for a specific title.
- 6.

### **User Functionalities:**

- 1- Register by Username and password.
- 2- Log in
- 3- Display latest news
- 4- Show news depending on specific category
- 5- Rate News

<b>Minimum Requirements</b>	<ul style="list-style-type: none"> <li>• Apply all functions mentioned in the description section.</li> <li>• Store your data in files or database</li> <li>• The project will be a console application.</li> <li>• Use suitable Data Structures ( <b>at least 2 different datastructures</b>) in your project. ( You can use STL)</li> </ul>
<b>Bonus</b>	<ul style="list-style-type: none"> <li>• GUI.</li> <li>• Add user comments to news where each user can see other comments on news.</li> <li>• Display news based on user's preferences.</li> <li>• View a timeline for a specific title</li> <li>• <b>Spam:</b> Add spam option for each news , if the user reports the post as spam , the post will disappear from this user's news and this news appears to others users with count of how many people spam it .</li> </ul>
<b>Evaluation</b>	<ul style="list-style-type: none"> <li>• will be based on the students' ability to use and apply the most suitable data structure(s) for the given task(s) and explain why they used these data structures and why they are better than other data structures in any given case.</li> <li>• Clean code is a must.</li> </ul>
<b>Development Tool</b>	<ul style="list-style-type: none"> <li>• Visual Studio</li> <li>• C++ Language</li> </ul>

<b>Title</b>	<b>Fantasy</b>
<b>Description</b>	<p>An application that implements <b>Only one</b> of the 2 below competitions:</p> <p>1) Home Décor Fantasy</p> <p><b>OR</b></p> <p>2) Football Fantasy</p> <p>Implement a program that allows the user to do the following requirements</p>

**Minimum  
requirements**

**For Home Décor:**

- Each player to have ID, username, password, budget & Decoration set (Min. 5 players)
- Multiple Décor stores, each has ID, Name, List of products and their prices
- Each User has ID, username, password & choice
- Admin that can control data entry/ removal/ updates of stores & products
- **Competition Idea:**
  - Competition to start as each player to buy products from stores, the target is to decorate a room in the house with a default “startup” budget of 100K
  - Each player can buy, sell or replace any of the products he owns within his budget (Budget to be updated with each process) - Player can search for any product, giving an output of product name, store it belongs to, points/ratings it has & price
  - Users will check the stores and give (Add, Update, Remove) ratings/points to products
  - Players who's their decoration sets get high ratings from users get the top rankings
  - Products price get increased or decreased per points given from users
  - By the end of the competition, Top 3 ranked players are displayed and top 1 receives a prize

**For Football:**

- Each player to have ID, username, password, budget & his created team of footballers (Min. 5 players)
- Multiple Teams, each has ID, Name, List of footballers and their prices
- Multiple leagues
- Admin that can control data entry/ removal/ updates of teams & footballers
- **Competition Idea:**
  - Competition to start as each player to buy footballers, the

	<p>target is to set up a team to play the next league match with a default “startup” budget of 100K</p> <ul style="list-style-type: none"> <li>- Each player can buy, sell or replace any of the footballers he owns within his budget (Budget to be updated with each process) - Player can search for any footballer, giving an output of footballer name, team he belongs to, points he has &amp; price - After each match played in a specific league, Admin to update footballers points per the goals they scored thus footballers price get increased/ decreased per new points</li> <li>- Players who’s their teams get higher points after each match played get the top rankings</li> <li>- By the end of the competition, Top 3 ranked players are displayed and top 1 receives a prize</li> </ul>
<b>Bonus</b>	<ul style="list-style-type: none"> <li>• Add violation rules</li> <li>• Lucky Wheel to pick a footballer/ product and add him/it to your team/ decoration-set (i.e., Random choice among footballers/ products)</li> <li>• GUI</li> </ul>
<b>Development Tools</b>	<ul style="list-style-type: none"> <li>• Use suitable Data Structures in your project (You can use STL)</li> <li>• Use <u>at least 2</u> different Data Structures</li> </ul>
